                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence represents a soluble variant of Streptolysin O (SLO) having no haemolytic activity. The variant SLO can specifically recognise wild-type anti-SLO antibodies (ASO) but has no haemolytic activity. It can be used for the determination of previous and/or current infection by Streptococcus pyogenes. It enables ASO assays to become commercially viable and avoids the risk of handling haemony.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       18-MAR-1993.

Claim 7; Fig 2; 60pp; English.
Claim 7; Fig 2; 60pp; English.
The sequence is that of a solible deriv. of Streptolysin O
with haemolytic properties which was obtd. from Streptococcus pyogenes
genomic library clone rSLO.3. It is useful in immunodiagnostic assays
which rely upon, e.g. the haemolytic properties of wild type
Streptolysin O. Recombinant Streptolysin O is obtd. more cheaply
than purified Streptolysin O obtd. from Streptococcus pyogenes.

Deriv. of thiol-activated protein streptolysin 0 - contg. no cysteine amino acid but retaining cytolytic activity, used for detecting antibodies in samples Disclosure; Fig 2; 9pp; English.

The SLO derivative contains no cysteine residues, with cytolytic activity giving resistance to inactivation by oxidation or thiol groups. Abs raised to the SLO may be used in the dection and diagnosis of Streptococcus pyogenes infection.

It may be of particular use before insertion of an in-dwelling device or any other invasive procedure. The protein, or nucleic acid encoding it, can also be used in vaccines to induce a cellular and/or humoral immune response, or to screen for other antibacterials. The DNA may also contain flanking sequences that are potential sources of control elements for bacterial gene expression. Detecting a sequence encoding the protein can be used diagnostically, e.g. to detect a mutation for serveryping or classifying infectious agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Listeriolysin O haemolytic domain peptide.

Listeriolysin O; haemolytic; domain; streptolysin O; pneumolysin; soluble molecular complex; specific; targetted; polynacleotide; endosome lysis; bacterial component; cytoplasm; therapeutic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /T 8

                                                                                                                          Ъ
                                                                                                                                                                                                                                                                                                          This sequence is a H. pylori protein of unspecified function. The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, infection or to identify H. pylori polypeptide binding compounds, is useful as potential H. pylori life cycle activators or inhibitors. The DNA and probes derived from it may be used for the identification of the pylori in a sample and the diagnosis of H. pylori infection. Nucleic acid sequences complementary to the DNA act as antisense sequences and can be used to prevent the translation of H. pylori mRNA. Antibodies and the protein can be used in immunoassays to evaluate the abundance of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF continued for spificant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR complification for recombinant polypentide production, e.g., in E. coli

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PT polypeptide(s) - useful in vaccines to treat or prevent H. pylori pri polypeptide(s) - useful in vaccines to treat or prevent H. pylori pri polypeptide(s) - useful in vaccines to treat or prevent H. pylori pri infection and for diagnosis of H. pylori infection process and another process.

Claims 14.93; Page 730-731; 1145p; English.

CC This sequence is a H. pylori cellular protein.

CC The protein may be used in a vaccine to prevent or treat H. pylori compounds, or the protein may be used for the protein or to identify H. pylori polypeptide binding compounds, or the protein or to identify H. pylori polypeptide binding compounds, or useful as potential H. pylori life cycle activators or inhibitors. The condition of the pylori in a sample and the diagnosis of H. pylori infection. Nucleic acid sequences complementary to the DNA act as antisense sequences and complementary to the DNA act as antisense sequences and can be used to prevent the translation of H. pylori mRNA. Antibodies can distribution of H. pylori-specific antispens. The genomic sequence of the pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed cor or or for at least 180 nucleotides, and the predicted coding regions confidence development, the amino acid sequences predicted from various or vaccine development, the amino acid sequences predicted from various or compliments, Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR camplification for recombinant polypeptide production, e.g. in E. coli

prippeptide(s) - useful for vaccines to treat or prevent H. pylori infection, and to detect Helicobacter PS Claim 56; Page 1166-1167; 1481pp; English.

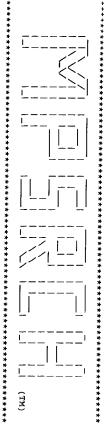

CC The present sequence is a Helicobacter pylori transporter protein. CC The protein may be used in a vaccine to prevent or treat H. pylori CC infection or to identify H. pylori polypeptide binding compounds, CC useful as potential H. pylori life cycle activators or inhibitors.

CC The genomic sequence of H. pylori (ATCC 55679) was determined from CC overlapping contigs generated by mechanically shearing the bacterial CC and the predicted coding regions defined by computer evaluation. To CC identify likely H. pylori antigens for vaccine development, the amino CC acid sequences predicted from various ORF were analysed for significant CC and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide Sequence 667 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

           New protein forming complex with heat shock protein - also binding immuno-suppressors, etc., and corresp. nucleic acid, antibodies etc., useful e.g. for detecting tumours, treating auto-immune disease, etc.

Claim 1; Fig 1; 43pp; French.

The HBI protein is able to complex chaperone protein hsp90, even when the chaperone protein is part of a hetero-oligomer with other proteins. Hsp90 can bind to steroid hormone receptors, vitamin D, and Tyrosine Kinases of viral oncogenes; HBI is thus useful for the

Infect. Immun. (1988) 56:3228-3234
Cloning and expression in Escherichia coli of the perfringolysin O (theta-toxin) gene from Clostridium perfringence and characterization of the gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tweten, R.K.

Infect. Immun. (1988) 56:3235-3240

Nucleotide sequence of the gene for perfringolysin O

(theta-toxin) from Clostridium perfringens: significant homology with the genes for streptolysin O and pneumolysin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A34951
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         B43577; A34951; A60922

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
